

ABSTRACT

An output controller 104 outputs coded data included in a packet arrived later than reproduction and display timing designated by a timestamp to a decoding section 105 together with coded data
5 included in a packet designated by a timestamp next to the above timestamp. The decoding section 105 first decodes coded data included in the packet arrived later and updates the reproduced image that
10 is one earlier than the above decoded reproduced image to the above decoded reproduced image, then decoding coded data included in the packet arrived before reproduction and display timing designated by the timestamp.
